## Homework #2. Basic TCP

Submit a single .zip file containing your solutions to the HW exercises. Only .pdf and files are accepted. Submit via agora by 21:00 on Monday 14<sup>th</sup>-October-2024.

### Introduction

The trace included below represents the lifecycle of a TCP connection between a client host (C) and a server (S). The C and the S processes run in their respective hosts (See fig. 1). Solve the questions included after the trace (The trace is composed of 11 packets which are numbered P<n> for convenience).

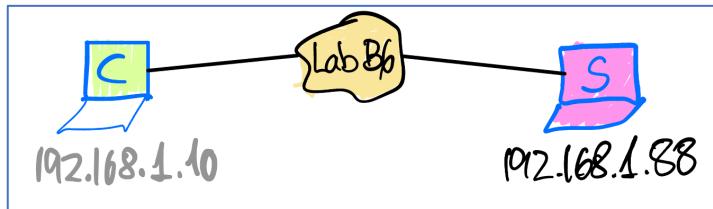

Figure 1. Client and Server hosts in Lab B6 network with their IP addresses

### tcpdump trace for TCP Analysis

```
$ /usr/sbin/tcpdump -i eno1 -vvv -n -X tcp port 50001
tcpdump: listening on eno1, link-type EN10MB (Ethernet), capture size 262144 bytes
```

```

**Questions about the trace above**

1. Which packets make up the 3-way handshake phase of the connection?
2. What is the client's IP address and TCP port?
3. Likewise, what is the server's IP address and TCP port?
4. What is the ISN (Initial Sequence Number) specified by the client? In which packet do you identify it?
5. What is the ISN (Initial Sequence Number) specified by the server? In which packet do you identify it?
6. When the server receives the ISN from the client, it should respond with a TCP segment that has the SYN flag set and an ACK SN that should one plus the received ISN. Check that this holds in the relevant packets. Which packets are those?
7. What is the purpose of packet P3?
8. Packet P4 is used by the client to send a block of bytes which SN covers the range 1:15. Is that true?
9. What packets sent by the server acknowledge the block of data mentioned in the preceding question? List them all.
10. What's the purpose of sending segments with no payload, if any? Set an example of one of such segments?
11. Calculate the MTU of the underlying Ethernet, by hand.
12. Identify the first *small segment* that appears on the data transfer phase included in the trace (A small segment is one that has a size less than MSS?)
13. Check that packet P9 has its ACK flag set. Use the hex dump for identifying the position of the ACK bit. You will want to consult the TCP header from RFC 9293.
14. Check whether all of the segments that belong to the data transfer phase have their ACK flag set.
15. Identify some data transfer segments that have their SYN flag set
16. Which flags are set in the TCP segment which IP packet was sent in P11.
